00:00

This is my submission for the Geno FD's assignment. Okay. So, the brief was deliberately open, build AI native mini CRM and I think the most important decision I made was in technical.

0:16

It was about scope. A lot of people would build a general CRM and sprinkle AI on top. I didn't want to do that.

0:24

Uh, my bet was this, the most valuable thing. AI can do in a CRM is not automated. It's reduced friction at the moment a marketer makes a decision.

0:35

Who do I talk to? What do I say? Did it work? So I built everything around three questions. The product, the AI, and the system designs all follow from a single idea.

0:45

Let me show you. So, this is the dashboard. This is the dashboard. And the first thing is, I want you to notice, it's not the KPIs, it's this pipeline on the top right.

1:01

And this is the async callback loop running UI. You can see that here, async callback loop running. And every message that goes out to a shopper comes back as a reset.

1:15

Here, there is a reason, there is a reason you can see here. So, uhh, the delivered, opened, clicked, come, convert.

1:22

You started with independent random delays, of course. And, uhh, yeah. So, this is happening right right now in the background, I will, I'll, I'll come back to how I build this in the architecture section.

1:40

So, the KPIs. The KPIs, total choppers, message sent, uhh, message sent. Click through rate, attributed revenue, all update in real time as these callbacks come in.

1:54

You can see this total choppers, message sent, click through rate, campaign review. Yeah. And now, all choppers. So, 60 choppers realistic in the in D2C data.

2:10

That is like spent. Yeah. I have the created 6 source. Santa Claus. Six months, that is like, Champagne's high value loyal at its dorm and new.

2:21

So, the some champions is that the people who buy about, uh, 60,000, uh, Indian currency and high value people who.

2:31

What about 20,000, uh, loyal customers who are at all at plus 5000 orders, uh, in the recent 30 days. At risk is people who haven't been active for more than 60 days.

2:45

Dormant is like people who haven't been, uh, active in, like, 90 plus days. And you, or people who are just placed in order, and they are currently the new customers.

2:56

So, yeah. And, 60-ish. And we all have this order, and we have this order count days since last purchase. Each chopper gets a behavior school.

3:06

So, we have this behavior school, as I told you in the before. Yeah. Like, everyone has- has this behavior school.

3:14

Uh, I compute from these three signals, search and filter work instantly. So, now we go for the segments. Uh, six behavior segments.

3:25

As I told you already, champions, high value, address, domain, new, shop is loyal. It is defined by your rule against this shopper data.

3:33

Uh, but here's where AI comes in. This say, AI segment build up. So, a AI segment builder, here we can see this.

3:42

So, let's say shoppers, oops. And it's also just Okay, thank about 2000 and get this.

4:01

Yeah. So, this is, this comes at a heart risk 33 shoppers. Please. So, this much, this much is my described criteria.

4:11

So, here were AI segments. Sigma and Builder plays a major role. And I describe my audience in, like, plain English.

4:21

Gaze shoppers who spent over 20,000 rupees, but haven't bought in this last four to five days. We have this, yeah.

4:28

And. Now. AI. Compulsor. So same idea in the campaign. Compulsor. I describe my goal when back dominant shoppers with a summer offer.

4:43

And the AI writes a short personalized eye converting message. With the shoppers name as a variable. There's also a smart segment pick up.

4:52

Where we can describe your goal, get an audience recommendation. E-mail. You
